The Intel PROSet software allows users to centrally administer wireless networks, devices, and users. Proset provides a single, self-service interface for managing all wireless users on an entire network. Administrators can provide individual or group users with wireless network profiles that contain wireless settings and security information, such as network keys or passwords, encryption algorithms, and which policies to apply, and Proset manages these settings for the users across the wireless network. Once a user has successfully connected to a wireless network and is authenticated, the user can connect to the network with the tools provided in Proset. Intel Proset supports user configuration, and all kinds of wireless network and device configurations can be defined. Proset can be used to define the key usage on the wireless network. For example, users can be restricted to only using a router's Ethernet port and not WAN port, or be restricted to using the WAN port, the router's Ethernet port, and a wired or wireless LAN adapter for access to the network. Users can also define the network keys that must be used to access the network. Standard predefined profiles are also provided to provide users with a starting point for configuring their wireless networks. Use Intel Proset to centrally manage and configure wireless networks, and build an up-to-date network without the help of a network administrator. 0 comments Sign in Sorry, no user registration is allowed.
